Simple example for text-decoration

The "text-decoration"-property describes decorations that are added to the text of an element. If the property is specified for a block-level element, it should affect all inline-level descendants of the element (does not work yet!). If it is specified for (or affects) an inline-level element, it affects all boxes generated by the element.

Example: <u>underline</u>

```
<fo:inline text-decoration="underline">underline</fo:inline>
```

This is simple test of the text-decoration<u>underline</u>.

This is simple test with a <u>bigger</u> font-size.

```
This is simple test with a monospaced font.
```

The following text decorations are defined in the CR:
- none
- <u>underline</u>
- overline
- ~~line-through~~
- blink
- no-underline
- no-overline
- no-line-through
- no-blink

Combination of property values should also be possible, but does not work in FOP at the moment.

```
<fo:inline text-decoration="underline overline">
Combination</fo:inline>
```

And now <u>more than a word...</u>

<u>This is a whole block wrapped in fo:inline with the property text-decoration="underline". Some more Text to get at least two lines.</u>

This is simple test with a bigger font-size.

```
This is simple test with a monospaced font.
```

What about underlining of whitespace only ?
